Cultural Directions

Gladioli will grow and bloom under most conditions, but like any other growing thing they respond to good treatment with larger spikes and blossoms.

They must have sunshine. Do not plant under trees or in shade. Do not plant near shrubbery to be robbed of food and drink. Better not plant against houses. Give them an open sunny place; none better than the open vegetable garden.

Soil should be well prepared and reasonably rich. If fertilizer is needed do not use barnyard manure unless old and well decayed. The prepared ground sheep manure, or bone meal may be used. Put fertilizers clear under or over bulbs and not in contact with them. Spade ground deep and pulverize well. Cultivate often and do not let ground bake or crust over them. If watering becomes necessary because of drought, soak thoroughly, (never sprinkle lightly) then let them alone for a week.

Plant from early garden making time to middle of June for latitude of Michigan. About middle of May is usually best time.

Plant five or six inches deep, not less than five or six inches apart. If you have a number of them, make three plantings ten days or two weeks apart.

When frost comes take bulbs up, cut tops off close, leave in sun and wind for few days, then put in airy place safe from frost three or four weeks. Clean off old bulbs and roots. Store away in shallow crates or boxes in fruit or vegetable room for winter. Keep cool and dark. Do not let them freeze.

For Cut Flowers

Cut spike when first bud opens, leaving at least four or five leaves on stalk to mature the bulb. Place in water and change the water each day, at the same time cutting a little off the end of stem.
